

Python Variables – Practice Questions

Q1.

Write a Python program to create three variables:

- one integer
 - one float
 - one string
- Print their values and their data types.
-

Q2.

Correct the following invalid variable names and write a program to print them:

- `1a`
 - `var one`
-

Q3.

Write a program to demonstrate that Python variables are **case-sensitive**.

Q4.

Write a program to:

1. Assign a value to a variable
 2. Delete the variable using `del`
 3. Try to print the variable
-

Q5.

Write a Python program to assign the same value to three variables in a single line and print them.

Q6.

Write a program to assign different values to three variables in a single line and print them with labels.

Q7.

Write a Python program to swap two variables **without using a third variable**.

Q8.

Write a program to demonstrate **global and local variables** using a function.

Q9.

Write a Python program that uses the `global` keyword inside a function and prints the global variable outside the function.

Q10.

Write a program to assign one variable to another and print the memory address of both variables using `id()`.

Q11.

Modify the previous program by changing the value of one variable and print the memory address again.

Q12.

Write a Python program to take name, age, and marks as input from the user and print them.

Q13.

Write a program to check and print the data type of a user-entered value.

Q14.

Write a Python program to perform addition, subtraction, multiplication, and division using two variables.
